

FUEL GAUGE - FFQ November 2002

During the recent 100 hourly, the fuel tank of FFQ was drained, and the opportunity was taken as it was refilled to make a fuel tank dipstick, and to check the accuracy of the fuel gauge.

The fuel gauge was found to be quite inaccurate (see diagram below). It is therefore advised that the dipstick should be used as part of the Daily Inspection, and/or whenever there is any doubt as to fuel quality.

The dipstick is stored in the blue esky in the T-hangar.
